HISTORICAL AND PROJECTED DEVELOPMENT

This map depicts both the historical progression of development and development projections for the years 2010 through 2040. The analysis is based on a density of permanent housing units per square mile. The shaded areas reflect an increase in density at which development begins to significantly impact natural resources.

Projections of development are projections of the California Department of Forestry and Fire Protection, and are intended to reflect the expected future land use and development. The projections are based on current land use and development trends in the state and are designed to ensure that future development is consistent with the state's land use and development policies.

Historical data were from a housing survey in the 2000 US Census of Population and Housing. For more information, please contact the California Department of Forestry and Fire Protection.
